# IGCSE 0607 Practice Questions — E2.6

## Inequalities

**Total Questions:** 33 — **Total Marks:** 192 Marks

---

## Table of Contents & Quick Navigation

- **E2.6** Inequalities
  → **Paper 2 (Non-Calculator)** *(18 Qs)* · **Paper 4 (Calculator)** *(15 Qs)*

---

**1** Solve the inequality.

$4(3x - 1) - 5x \geq 2(x + 8)$

..... **[3]**

**2** **(a)** Solve the inequality

$$3(x - 4) < 5x - 2$$

..... **[2]**

**(b)** Write down the smallest integer value of $x$ that satisfies this inequality.

..... **[1]**

**3** **(a)** Solve the inequality.

$$-5 < 3x + 1 \leq 13$$

..... **[2]**

**(b)** Write down all the integer values of $x$ that satisfy this inequality.

..... **[2]**

**4** **(a)** Solve the inequality.

$$-5 < 2x - 1 \leq 7$$

..... **[2]**

**(b)** Show your solution to part (a) on the number line.

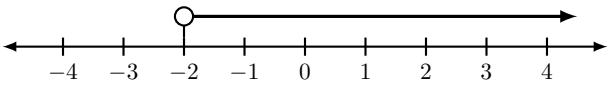

**[2]**

**5** **(a)** Solve the inequality.

$4x - 3 < 2x + 9$

..... **[2]**

**(b)** Write down the inequality shown on the number line.

..... **[2]**

**6** **(a)** Solve the inequality.

$3(x - 2) \leq 5x + 8$

..... **[3]**

**(b)** Represent the solution to part (a) on the number line.

**[2]**

**7** **(a)** Solve the inequality.

$3x - 2 > 5x + 7$

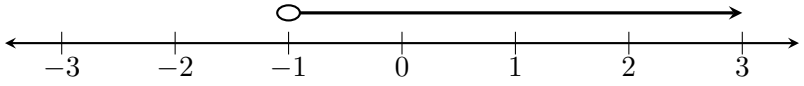

..... **[2]**

**(b)** Write down all the integer values of $n$ that satisfy the inequality.

$-5 < 2n - 1 \leq 3$

..... **[3]**

**(c)** An inequality is shown on the number line above.
Write down the inequality.

..... **[1]**

**8** **(a)** Solve the inequality.

$4x - 3 \leq 7x + 12$

..... **[2]**

**(b)** Solve the inequality.

$-8 < 2x - 1 \leq 7$

..... **[2]**

**(c)** Write down the largest integer and the smallest integer that satisfy the inequality in part (b).

Largest = ..... , Smallest = ..... **[2]**

**9** **(a)** Solve the inequality.

$2 - 3x < 11$

..... **[2]**

**(b)** Solve the inequality.

$4(2x - 1) \leq 5x + 17$

..... **[3]**

**(c)** $n$ is an integer such that $2 - 3n < 11$ and $4(2n - 1) \leq 5n + 17$.
Write down all the possible values of $n$.

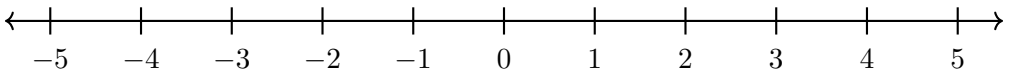

..... **[2]**

**10** **(a)** Solve the inequality.

$3x - 5 \leq 7x + 3$

..... **[2]**

**(b)** On the number line, show the solution to the inequality in part (a).

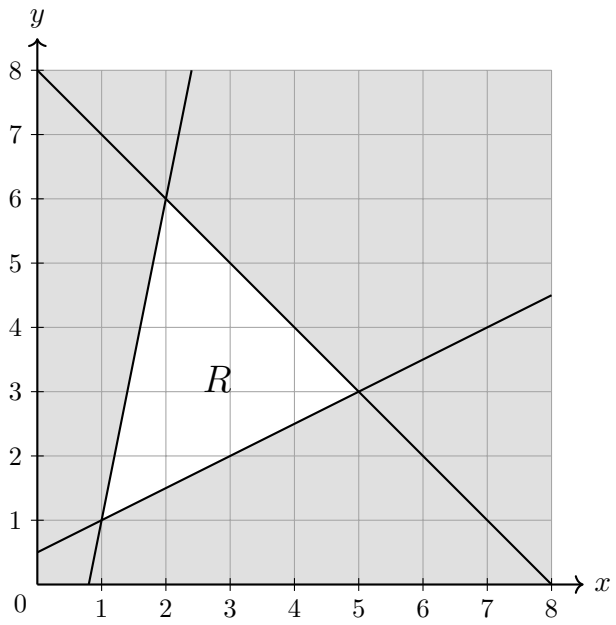

**[2]**

**(c)** List all the integers that satisfy the inequality.

$-2 < 3x - 5 \leq 4$

..... **[3]**

**11** The diagram shows a region $R$, which is unshaded.
The unwanted regions are shaded.

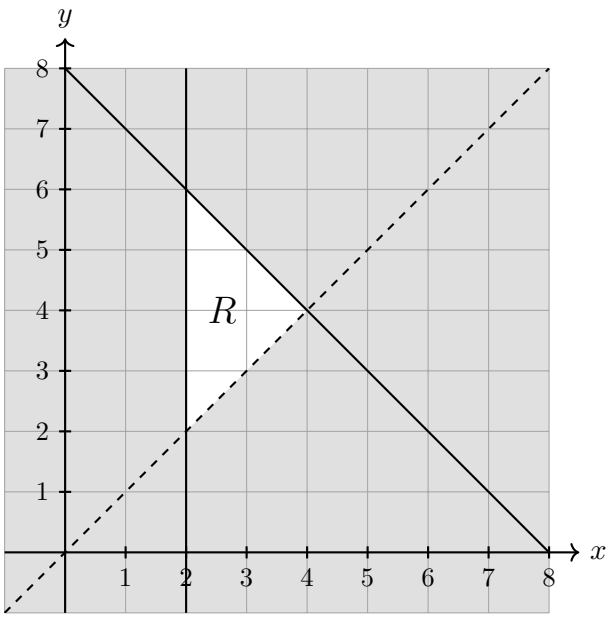

Write down the three inequalities that define region $R$.

.....

.....

..... **[3]**

**12** The diagram shows a region $R$ defined by three inequalities.
The unwanted regions are shaded.

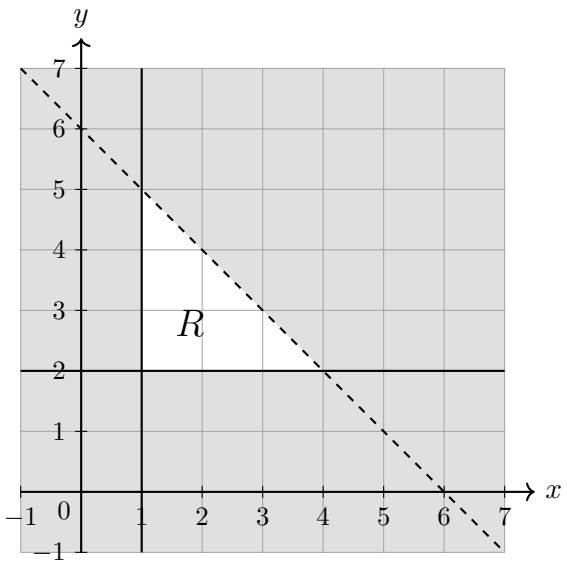

Write down the three inequalities that define the unshaded region $R$.

.....

..... **[3]**

**13** The unshaded region $R$ is defined by three inequalities.
The boundaries of the region are shown on the coordinate grid.

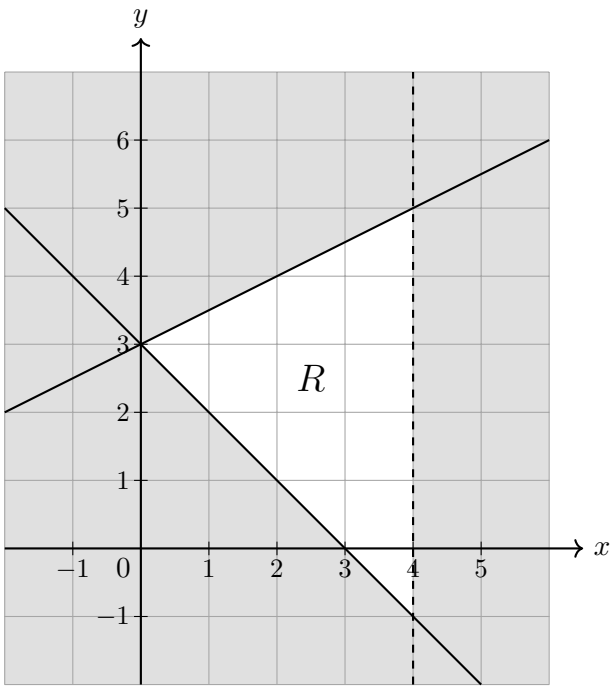

Write down the three inequalities that define the unshaded region $R$.

.....

.....

..... **[3]**

**14** The unshaded region $R$ is defined by three inequalities.

**(a)** Write down these three inequalities.

.....

.....

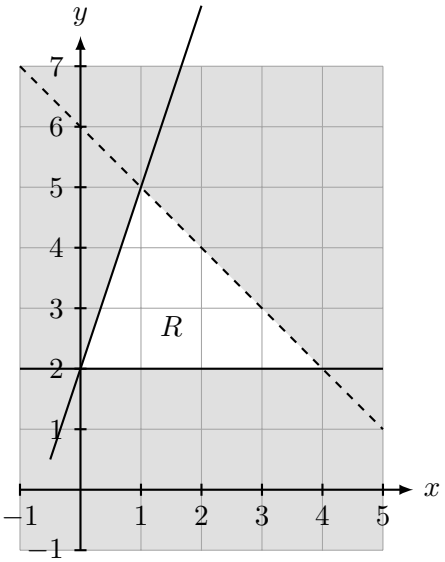

..... **[3]**

**(b)** The point $(a, b)$, where $a$ and $b$ are integers, lies in the region $R$.
It is given that $a = 3$.

Find all possible values of $b$.

..... **[3]**

**15** A region $R$ is defined by three inequalities.

The region $R$, unshaded, is defined by three inequalities.
Write down these three inequalities.

.....

.....

..... **[6]**

**16** **(a)** Solve the inequality.

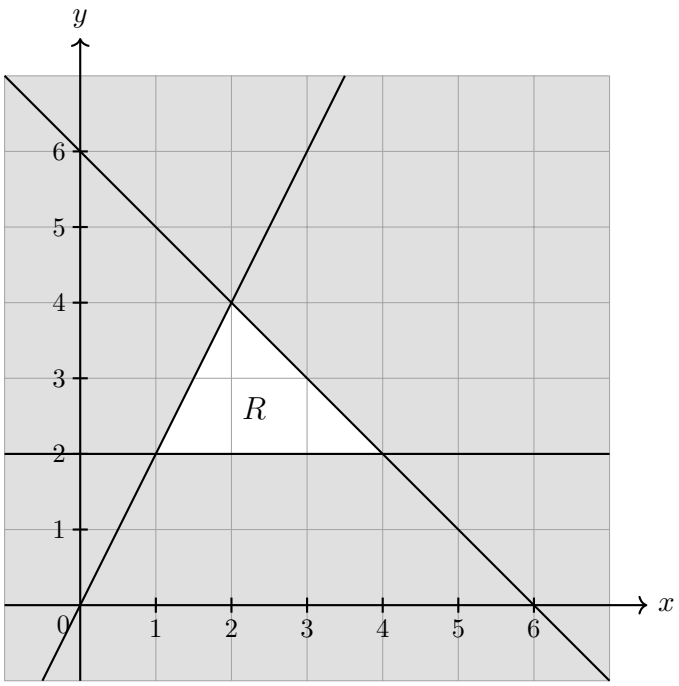

$$\frac{3x-2}{5} - \frac{2x-5}{3} \leq 2$$

..... **[4]**

**(b)** A region $R$ is defined by the three inequalities $y > x$, $y < 4$, and $x + y > 2$.
Write down all the points in region $R$ that have integer coordinates.

..... **[3]**

**17** The diagram shows a region $R$ unshaded.

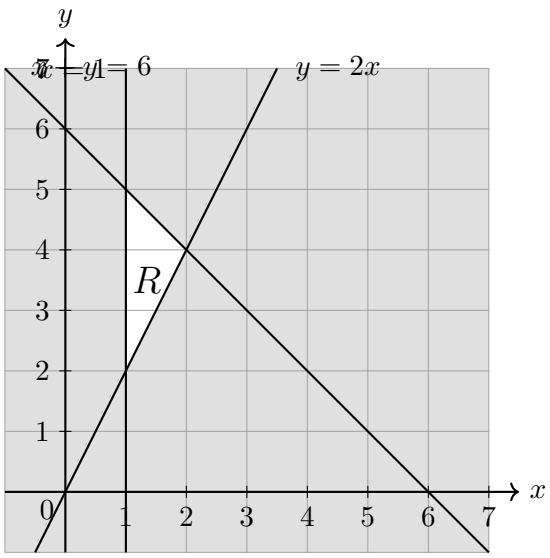

Write down the three inequalities that define the region $R$.

.....

.....

..... **[3]**

**18** The diagram shows three straight lines: $x = 1$, $y = 2x$, and $x + y = 6$.
The unshaded region $R$ is bounded by these lines.

Write down the three inequalities that define the unshaded region $R$.

.....

.....

..... **[3]**

**19** **(a)** Solve the double inequality.

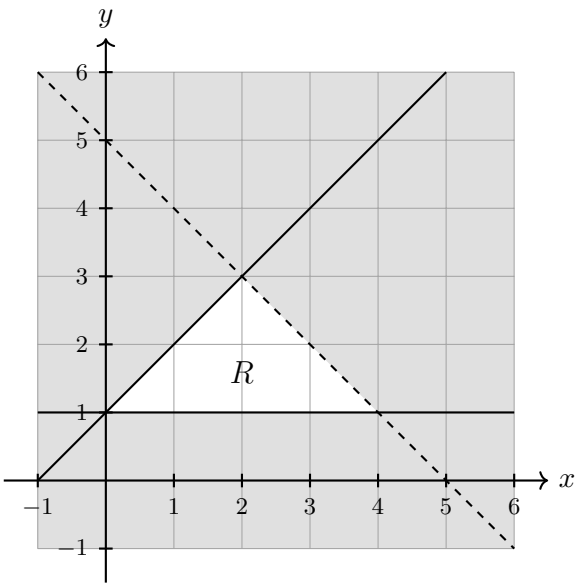

$$-7 \leq 3x - 1 < 11$$

..... **[3]**

**(b)** Write down all the integer values of $x$ that satisfy the inequality in part (a).

..... **[2]**

**20** The diagram shows a region $R$ which is unshaded.
The unwanted regions are shaded.

**(a)** Write down the three inequalities that define region $R$.

.....

.....

..... **[4]**

**(b)** Find the point $(x, y)$, with integer coordinates, inside region $R$ which maximizes the value of $2y - x$.

( ( ..... , ..... ) ) **[2]**

**21** **(a)** Solve the inequality.

$$-5 < 2x + 1 \leq 11$$

..... **[3]**

**(b)** Write down all the integers that satisfy the inequality.

$$-2.5 \leq y < 1$$

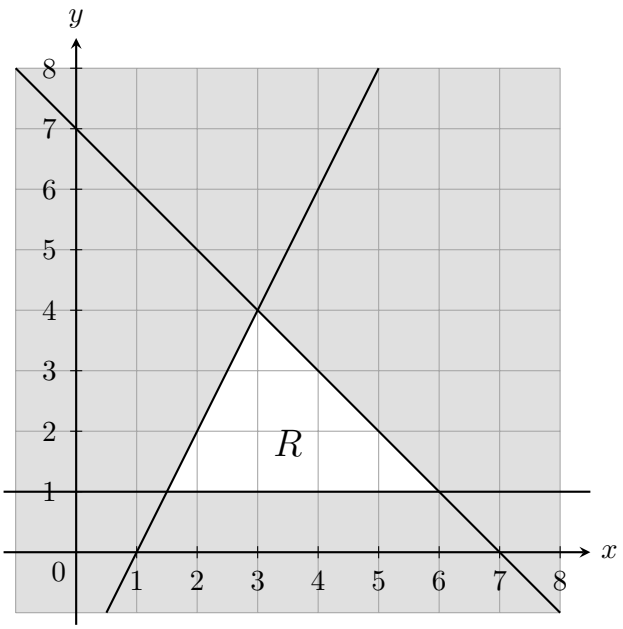

..... **[2]**

**(c)** Use your graphic display calculator to solve the inequality.

$$2x^2 - 7x + 3 > 0$$

..... **[2]**

**22** The diagram shows a grid with three straight lines.

**(a)** The unshaded region $R$ is defined by three inequalities.
The boundaries are included in the region $R$.
Write down the three inequalities.

.....

.....

..... **[5]**

**(b)** A point $(x, y)$ lies in the region $R$.
Both $x$ and $y$ are integers.
Find the maximum value of $2x + y$.

..... **[2]**

**23** A factory produces two types of bicycles: Mountain bikes and City bikes.
In a week, the factory produces $x$ Mountain bikes and $y$ City bikes.

- The factory produces at least 15 Mountain bikes.
- The factory can produce at most 40 bicycles in a week.
- The number of City bikes produced is at least half the number of Mountain bikes produced.

**(a)** Write down three inequalities, in terms of $x$ and $y$, to show this information.

.....

.....

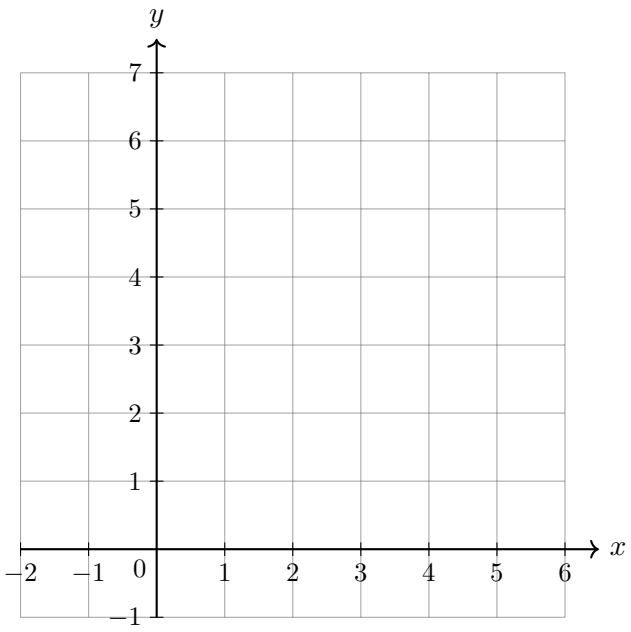

..... **[3]**

**(b)** The profit on each Mountain bike is \$400 and the profit on each City bike is \$150.
Work out the maximum possible profit the factory can make in a week.

\$ ..... **[3]**

**24** **(a)** On the grid, draw the lines $y = 2$, $y = x + 2$, and $2x + y = 8$.
Shade the unwanted regions to show the region $R$ defined by the inequalities:

- $y \geq 2$
- $y \leq x + 2$
- $2x + y \leq 8$

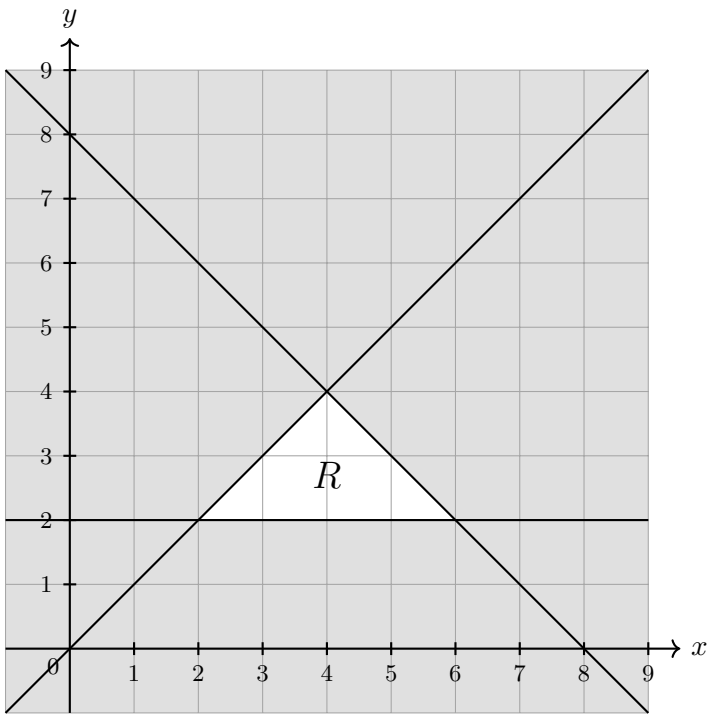

**[4]**

**(b)** Find the largest value of $3x + 2y$ for points $(x, y)$ in the region $R$ where both $x$ and $y$ are integers.

..... **[2]**

**25** The diagram shows three straight lines on a coordinate grid.

**(a)** The region $R$ is unshaded.
Write down the three inequalities that define the region $R$.

.....

.....

..... **[3]**

**(b)** Find the maximum value of $2x + 3y$ given that $x$ and $y$ are integers that satisfy these three inequalities.

..... **[3]**

**(c)** A point is chosen at random from the points with integer coordinates in region $R$.
Work out the probability that $x = y$.

..... **[2]**

**26** **(a)** Solve the inequality.

$$-5 < 2x - 1 \leq 7$$

..... **[2]**

**(b)** Find the smallest integer $x$ that satisfies the inequality.

$$\frac{2x-5}{3} - \frac{x-3}{4} > 1$$

$x =$ ..... **[3]**

**(c)** A taxi company, City Cabs, charges a fixed fare of \$3.20 plus \$1.50 per kilometre.
Another company, Metro Taxis, charges a fixed fare of \$5.00 plus \$1.10 per kilometre.
Construct and solve an inequality to find the minimum whole number of kilometres a passenger must travel for City Cabs to be more expensive than Metro Taxis.

..... kilometres **[3]**

**27** Tickets for a community show cost \$5 for children and \$10 for adults.
The maximum number of tickets that can be sold is 500.
The organizers must sell at least 150 adult tickets.
The total amount of money raised from ticket sales must be at least \$3000.

Let $x$ be the number of children's tickets sold and $y$ be the number of adult tickets sold.

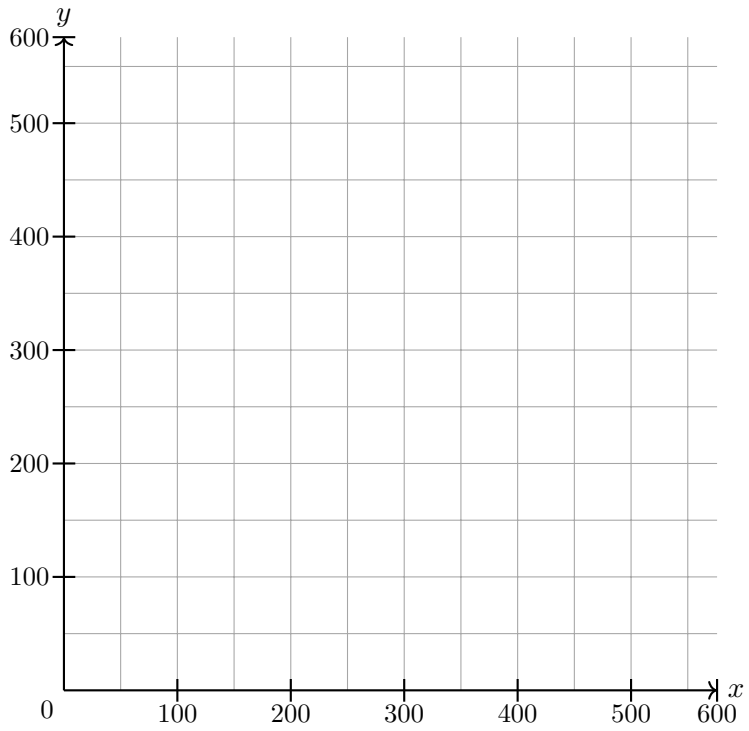

**(a)** Write down three inequalities in $x$ and $y$ to show this information.

.....

.....

..... **[3]**

**(b)** On the grid, draw three lines to show these inequalities.
Shade the unwanted regions to leave the region representing the possible number of tickets sold.

**[4]**

**(c)** The organizers want to maximize the number of children's tickets sold.
Find this maximum number of children's tickets and the corresponding number of adult tickets.

Children's tickets = ..... , Adult tickets = ..... **[2]**

**28** A carpenter makes $x$ tables and $y$ chairs each week.
The total number of tables and chairs made each week must not exceed 60.
The number of tables made must be at least 10.
The number of chairs made must be at least half the number of tables made.

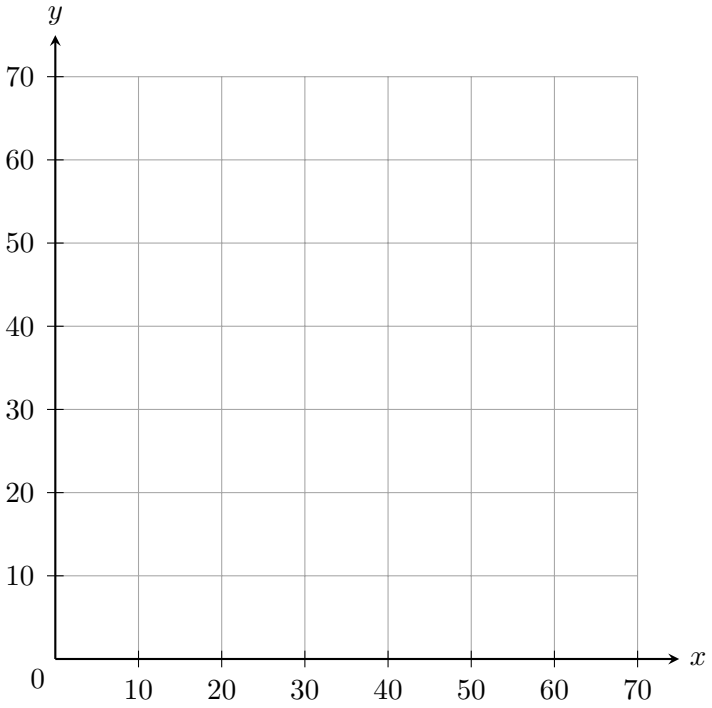

**(a)** Write down three inequalities, in terms of $x$ and $y$, to show this information.

.....

.....

..... **[3]**

**(b)** On the grid, draw three straight lines and shade the unwanted regions to show the region which satisfies these inequalities.
Label the region $R$.

**[4]**

**(c)** The profit on each table is \$40 and the profit on each chair is \$25.
Work out the maximum possible weekly profit.

\$ ..... **[2]**

**29** **(a)** Find the exact range of values of $x$ for which

$$\frac{2x-3}{4} < \frac{x+5}{3} \leq \frac{3x-1}{2}$$

..... **[5]**

**(b)** A mobile phone company offers two plans.
Plan A costs \$12 per month plus \$0.07 per minute of calls.
Plan B costs \$25 per month for unlimited calls.

Let $x$ be the number of minutes of calls in a month.

**(i)** Write down an inequality in terms of $x$ to show the condition when Plan B is strictly cheaper than Plan A.

..... **[1]**

**(ii)** Solve your inequality to find the minimum number of whole minutes of calls required for Plan B to be cheaper than Plan A.

..... minutes **[3]**

**30** **(a)** A factory makes $x$ Mountain bicycles and $y$ Road bicycles each day.

- The factory makes at most 60 bicycles in total each day.
- It makes at least 10 Road bicycles.
- It makes at least 15 Mountain bicycles.
- The number of Road bicycles is at most twice the number of Mountain bicycles.

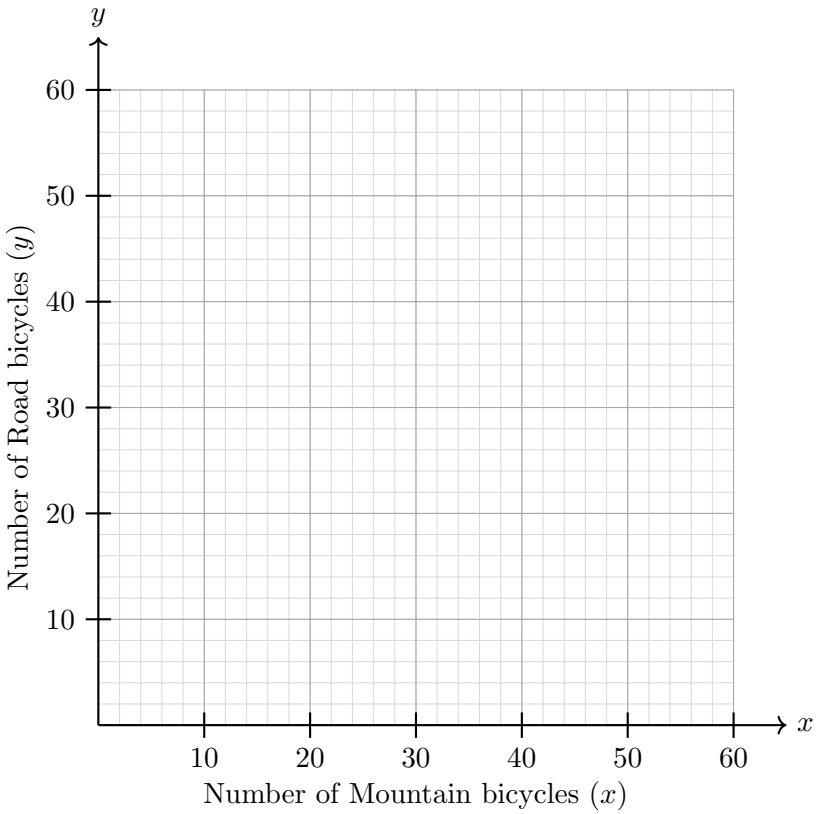

Write down four inequalities, in terms of $x$ and $y$, to show this information.

.....

.....

..... **[4]**

**(b)** On the grid, draw four lines to show these inequalities.
By shading the unwanted regions, indicate the region $R$ which satisfies all four inequalities.

**[5]**

**(c)** The profit on each Mountain bicycle is \$30 and the profit on each Road bicycle is \$50.
Find the maximum possible profit the factory can make in one day, and the number of each type of bicycle it must make to achieve this profit.

Maximum profit = \$ .....

Mountain bicycles = .....

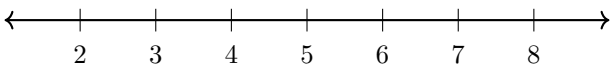

Road bicycles = ..... **[3]**

**31** **(a)** Solve the inequality.

$$3(2x - 1) > 4x + 7$$

..... **[2]**

**(b)** On the number line, represent the solution to the inequality in part (a).

**[1]**

**(c)** Write down the smallest integer value of $x$ that satisfies this inequality.

..... **[1]**

**32** **(a)** Solve the inequality.

$$-5 < 2x - 1 \leq 7$$

..... **[2]**

**(b)** Write down all the integers that satisfy the inequality in part (a).

..... **[2]**

**(c)** A rectangular garden has length $(3x + 2)$ metres and width $x$ metres.
The perimeter of the garden is strictly less than 40 metres.

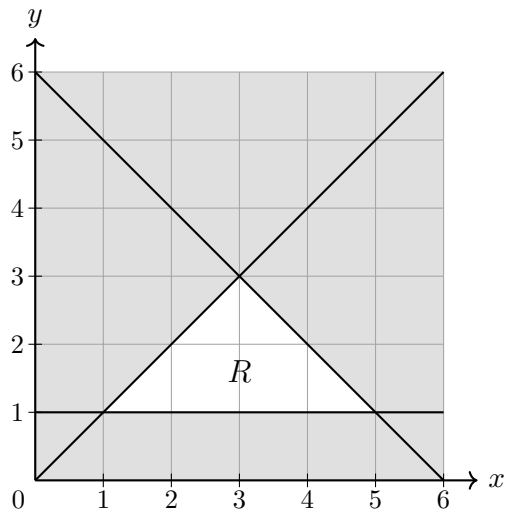

**(i)** Write down an inequality in terms of $x$ and show that it simplifies to $x < 4.5$.

**[2]**

**(ii)** Given that $x$ is a positive integer, find the maximum possible area of the garden.

Area = ..... $m^2$ **[2]**

**33** The diagram shows a grid with three straight lines and an unshaded region labeled $R$.

**(a)** Write down the three inequalities that define the unshaded region $R$.

**[3]**

**(b)** Find the maximum value of $3x + 2y$ for integers $x$ and $y$ that lie in the region $R$.

..... **[2]**
